URL:

Damn right, win32:

```
$ cat test.cpp
#include <stdio.h>
int main()
{
    char _direction;
    _direction = -1;
    printf("_direction = %dn",_direction);
}

$ gcc test.cpp -o test
$ ./test
_direction = -1
```

Amigaos4:

```
2/10.Work:test> cat test.cpp
#include <stdio.h>
int main()
{
    char _direction;
    _direction = -1;
    printf("_direction = %dn",_direction);
}

2/10.Work:test> gcc test.cpp -o test
2/10.Work:test> ./test
2/10.Work:test> _direction = 255
```

So seems just different defaults. Strange through why differences have a place at all between platforms in such case.
