i've created a new clib2 repository and i've started to remove some old stuff (i mean 68k one)

<https://github.com/afxgroup/clib2/releases/tag/1.0>

I've merged your math functions and i've added some new functions.

Not only. I've merged linux and lnet into libc because the linking was a pain and is useless to create different lib since they are libc part.

Do you think we can work on a single project? or do you want to maintain the 68k stuff?
