If your project compiles and runs, it means it just uses pthread library, not that "c++ threading": they are 2 different things.

With C++ threading, if you have no support for it in GCC, your project will even not compile.

In other words, if your code compiles and works, you have no needs to worry about c++ threading. The 5.4.0 version is ok too.

Currently, most of us use 8.4.0 and 10.1.0, but that for more or less "modern" code (for porting works for example, etc). But most of the stuff will work on 5.4.0 still.
