Enhancer core listviewer gadget

Hi

Following on from trixie's excellent advice at <https://www.amigans.net/modules/xforum ... id=122939#forumpost122939> I've started building a program using the enhancer core classes. The toolbar gadget is great but I'm getting stuck with the listviewer gadget. The documentation, like my brain, is a bit sparse, so I thought that I'd ask here.

1. The gadget seems to create an extra unusable column to the right of the columns that you specify. This takes up extra space that could be used by the columns with data in and affect the minimum size of the window. If you look at <https://photos.app.goo.gl/h8h3dsWX9rLPWYft5> you can see an extra column after the "comment" column in the 1st window and the one after the name of the image in the second one.

2. How do you react to the user selecting/activating an item in the list. I couldn't find any examples of this in the example programs and I couldn't get it to work with using WMHI_GADGETUP or something similar.

cheers

billy
