Is it now doesn't matter if i use Makefile.amigaos4 with SDL2 or just my usual:

Quote:

```
./configure --build=x86_64 --host=ppc-amigaos --target=ppc-amigaos --disable-altivec
```

?

Anyway, i just grab latest sdl2 code, and tried it like this:

Quote:

```
./configure --build=x86_64 --host=ppc-amigaos --target=ppc-amigaos --disable-altivec  
CFLAGS="-mcrct=clib2"
```

And then:

```
/amiga/SDL2_30_01_2021/src/file/SDL_rwops.c:393:36: error: 'FILE' {aka 'struct <anonymous>'}  
has no member named '_flags'; did you mean 'flags'?  
  if ((context->hidden.stdio.fp->_flags & __SL64) == 0) {  
      ^~~~~~  
      flags  
/amiga/SDL2_30_01_2021/src/file/SDL_rwops.c:393:45: error: '__SL64' undeclared (first use in this function)  
  if ((context->hidden.stdio.fp->_flags & __SL64) == 0) {
```

configuring that without -mcrct=clib2, then everything builds fine for newlib.
