URL:

take a look at my repository and try the clib yourself. It has a lot of fixes (like shared objects and threads) plus a lot of other stuff that is missing in olaf clib2.

But i have changed file **/gcc/repo/gcc/config/rs6000/amigaos.h** in gcc to work in this way

```
/* clib2 startfile should work for all library flavours */
#define STARTFILE_CLIB2_SPEC "
%{shared: %(base_sdk)clib2/lib%(lib_subdir_type)/shcrtbegin.o} %!shared: %(base_sdk)clib2/lib%(
lib_subdir_type)/crtbegin.o}"

#define ENDFILE_CLIB2_SPEC "
%{shared: %(base_sdk)clib2/lib%(lib_subdir_type)/shcrtend.o} %!shared: %(base_sdk)clib2/lib%(
lib_subdir_type)/crtend.o}"
```

But this code will not work with threadsafe version because i have to find a way to supports all clib2 variant. And however, for example, why we should have a ts version and one not? Is really useless imho
