Well, it is a port i've made to test my new clib2 and the shared objects (plus tons of other changes).
It is working. It seems to work. For example cmath module is using the .so object and the new complex functions into clib2.
There are some modules to add. However with new newlib changes should be easy to recompile it too.
Mine was a test to see if dlopen/dlsym was working correctly and allow me to test my changes
If it will work correctly i'll release it.
However, a newlib version should be better IMHO
