AmigaOS python that comes with OS is heavily adapted to be 'Amiga like' with support for Amiga style paths and several os based modules much more under the bonnet. Buiding a loonixy python is easy (no disrespect to afxgroup). Getting the amiga stuff patched in is more of a job.

Getting clib2 shared objects working is quite cool. Though I shudder at the idea of managing two sets of incompatable shared objectrs. I wonder if it might be a good idea to use a different suffix? .c2so perhaps?

For perl I made it's modules use .pso
