well, with latest clib2 changes if i find something that is breaking the configure i'll try to fix it into clib2. Indeed with python i've just added amigaos4 because i was cross compile. But for almost all unix ports i didn't touch any line in configure. However at moment clib2 is just internal because it can't work with actual gcc I've patched it to use a different crtbegin and crtend like newlib and compiled with -fPIC otherwise it won't work. Another problem (don't know if it is a real problem) is that the destructors are never called even if call InitSHLibs with FALSE as parameter. while constructors are called correctly. And however it is better always to use the static version if dlopen/dlsym is not needed. Just to avoid those problems
