Now uses separate paths for each ASL requester, so it should be more convenient if you have modules in one dir and samples somewhere else

Oh cool, thanks - a small addition for the programmer but a giant leap for the composer! And as I was the one requesting this feature, I'll send a small donation your way.

Two more little things come to mind with regard to the next release candidate:

- Could you please add a version string?
- Because the Amiga port handles file paths in its own way (through ASL), perhaps you could also add icon tooltypes for the default module and sample paths for the ASL requester to pick up?
