Updated repo with :

1). added original and old amigaos-nat.c from old version of our gdb from adtools on sourceforge.

2). changed gdb/config/amigaos.mh, so amigaos-nat.c will be compiled and linked now.

3). get rid of most compilation errors in it (see latest commits history). There were just one DOS difference, then bunch of pure-rename functions in the GDB itself since v.6.3 times, and disabled sobjs for now (first we need to make it works at all).

Now, what is left is 2 undefs on compiling stage

PC_REGNUM
and
current_regcache

"PC_REGNUM" it seems now "gdbarch_pc_regnum (gdbarch)", or maybe "PPC_MQ_REGNUM", that need to be checked with context. And "current_regcache" in our case it seems now just "regcache". Through, both of them give me "undefined" so probably some gdb includes need to be added or something. Seems those ones need to be changed in the function's arguments and filled in some other functions.
