My new 34" ultra wide QHD display arrived today (Asus VG34VQL1B).

First of all, 3440x1440 brings a complete new experience to AmigaOS IMHO. This resolution and size make it possible to using Codebench, the SDK browser and Odyssey side by side in a convenient way. So the lack of multi monitor support is fully compensated if you ask me.

But now the question. I have a X5000 with MSI Radeon R9 270x OC (2GB) and V3.6 of the RadeonHD driver. I do get 3440x1440@60Hz using HDMI. Display port on the other hand shows uboot and the startup animation, but goes to black once workbench is opened. Is this a known limitation of the RadeonHD V3.6 driver? Do I have the wrong Radeon brand? Or are there any tooltypes or settings to enable display port support?
