Ok thanks. Too bad because the displayport of my radeon is supposed to provide about twice the amount of bandwidth compared to the hdmi port. So it would have been nice to have a 100Hz refresh rate instead of 60Hz.

This also means that UHD (4K) is only supported up to 30Hz. I tried this with my TV and I cannot recommend this to anyone. You can see refresh issues when you move windows around. although there is no processing power issue, the system still feels sluggish.
