The `ftello64()` call that returns `ESPIPE` ("Illegal seek"), is that on a file handle opened by `fopen64()` or is it a regular `fopen()` one? If it's the latter it would explain the error.

The newlib 3.1.0 `fseeko64()` falls back on regular `fseeko()` if it's called on a `FILE` pointer not from `fopen64()`, a feature that I will be adding to our newlib port as well in the next beta release.
