And compiled it with g++ version 4.2.4 but didn't hit the same issue. bits/stl_algobase.h includes <utility> which is a header in the C++ standard library and also a directory in the AmigaOS 4 SDK but I don't understand how these get mixed up now.

In older adtools gcc ports the SDK include directories were before the gcc prefix include directories, which is probably why the SDK:include/include_h/utility directory is causing problems. This has been fixed in newer adtools gcc ports since it caused even more problems for C++ support with gcc 6 and later.
