Thank you for the kind words.

I also noticed during testing that skaitv script didn't have -q quality arguments, that make my script to fail, while different qualities are listed in the vwq script.

So I commented out the lines with the requester and added another condition before launching the script without the -q argument:

```
elif website == 'skaitv':
    vqualitylist = ' | '.join(str(n) for n in vqw.skaiVQW)
# response = asl.MessageBox("Quality choice", "Please select a video quality: ", vqualitylist)
# vquality = str(vqw.skaiVQW[response-1])
...
if website == 'other':
    os.system('APPDIR:Mplayer -cache 8092 ' + url)
elif website == 'skaitv':
    os.system('C:Python ' + AIOspath + '/' + website + '.py ' + '-shh -u ' + url)
else:
    os.system('C:Python ' + AIOspath + '/' + website + '.py ' + '-shh -u ' + url + ' -q ' + vquality)
```

I also tried the skaitv script alone with a video url and with the -l only, but it gave me a url open error.

```
<urlopen error (1, 'error:14094410:SSL routines:ssl3_read_bytes:sslv3 alert handshake failure')>
```

Regards,
