Multi monitor is possible with most Amiga's, even the classic supported more then 1 graphics card. The 'problem' is that 1 Amiga screen can't be divided on more then 1 monitor.

In fact I had a X1000 with 2 Radeon 7750's running a 4K Workbench screen and Pppaint on the other monitor.

But if you can't use more then 1 gfx-card there is always the Matrox solution I used:

<https://www.youtube.com/watch?v=buCtNuP--bl>

But in this case limited to 3840x1024 pixels on 3 monitors and not so thin bezels...
