Yes, your sandbox idea is pretty good, but it has one major problem, and it is that you need wrap a hell of a lot of functions, but it has some advantages, you can add resource tracking to the sandbox, it can also provide chipset support, and it can interact with native program to a degree.

It reminds me of vamos project,

<https://lallafa.de/blog/amiga-projects/amitools/vamos/>

there is also the janus-UAE project, tried to do something similar.

I think idea was not bad, but it needs a lot more work.

Not just some simple patches.
