I ran through the individual elements that were updated, then I ran the Enhancer installer again. Still got the error, clicked through it to run the install...

My userstartup was failing on reboot. It was looking for RapaGui which it couldn't find. Hmm, weird, I don't usually get that error. So I booted into my BU partition, commented it out, and rebooted...

and now I have a non-booting partiton. Gets to the splash screen and no further.
