I have 2x4GB 1333MHz in my X5000/20.

But like I said. A normal boot or reset is fine. This crash only happens after I've changed and saved a monitor setting with screenmode pref.

I can easilly reproduce this crash:

- 1) Boot into workbench
- 2) Open sys:Prefs/ScreenMode
- 3) Go to "Monitors" tab
- 4) Uncheck + check "Detect settings automatically" box. (I have it checked by default)
- 5) Go back to "Available Modes" tab
- 6) Press "Save"
- 7) Press "save" again in the popup window
- 8) Press "Reboot now" in the second popup window
- 9) System reboots and halts with no monitor output on hdmi.

This will always result in the first crashlog in posting #130.

Doing the same steps with RadeonHD driver and a R9 270X is fine.
