from Hans on Mantis:

Geennaam needs to create his own bug report, although I highly recommend he checks his power supply. Like I said above, IExec->GetCPUInfoTags() has to lie about the CPU type to get the memory coherence message on an X5000, and that's a very serious matter.

Bear in mind that v2.x enables GART for command buffers. This speeds up sending commands to the GPU, which in turn can increase power consumption...
