Ok, i'll order a new PSU (current one is 630W). But that must be a power surge than when I switch screenmode. Because the RX560 only draws power from the PCIe slot. 3D games like HCRAFT plays fine in uwqhd. Without GART, 1080p movies play fine as well.

The R9 270X draws also power from 2x6 pin molex headers. This implies a much more power hungry card. (have to check the specs)

I'll also try if it makes a difference when I connect a DVI display.
