Kas1e has a newer UBoot, but he does not have any problems with RadeonRX2.4 driver. And maybe A-EON testers were also using newer UBoot ?

I may put old Uboot back (it's just on another SD card, so no issue). What do I need to do to reproduce the issue with 100%?

ps. but it's just me have this beta of uboot, other beta testers in aeon probably didn't have it, at least not all of them for sure.
