Thanks for response. The older version I have installed on my X1000 since ages is 0.90.80. It plays back fine. I don't ever create anything with it, just play modules made by others. Only thing I don't like about this version is I cannot figure out how to tell its built-in file requester to go to another device/volume -- only to folders going back to root. Probably I am missing something obvious.

Was pleased to see your version uses ASL, and that works a treat. Just have this problem where playback is bad. In fits and starts, very choppy. Maybe there is a setting I can adjust if this is not a bug???

Again, I am using an X1000 with Lyle's audio driver for onboard sound, and I am running OS4.1 FE Update 2.
