I just tested it with my RadeonHD Verde card I had in X5000 previously.. And anyway, shouldn't on serial I have something like "no bootable device found" or something, or, when RadeonHD didn't work those latest "VESA: OK" mean system freezes?

What's the exact model ? On some HD cards not all ports works under u-boot, try using VGA if you're using DVI/HDMI or viceversa.

On the serial output, the "VESA: OK" is usually the last message, after that u-boot will output on the gfx board.
