You can use a serial terminal connect to the Sam460 instead of a keyboard (115200 baud, 8N1)

Yeah, that what I do with x5000 and peg2, just to be able to type commands from serial I need to set FLOW CONTROL to NONE as well in putty.

But with x5000 for example I can't type like it. I should press "Esc", then, press "down" 4 times (so visually cursor comes to the "command line" which I didn't see on the serial), and hit enter. And only then I have x5000> prompt where I can type commands.

With sam460, I have just VESA: OK, and no prompt. So, should I when sam460 boots, hit "ESC" or something and hit some buttons to have uboot prompt?

@Spectre (and others with sam460)

Can anyone check plz the combinations of keypresses to go to the command line of uboot ? I.e. should i hold "ESC" on boot and then will have a command line, or should I press something else?

Thanks!
