I just tried to boot up from this USB stick on x5000: it loads up all kickstart modules from (i can see how USB led blinks) and then crashes with illegal instructions as expected. But on sam460 it just blinks about 10 times, like starting (or tried) to do something, but nothing close to booting.

And yes, if I put that USB stick to x5000, it shows up things well and I have therein kickstart RadeonHD and Radeon RX, and in kick layout, both are tried to be loaded.

It's like, it still didn't boots up on sam460. Maybe it should be used internal USB from sam460 (like one of those J12 or J13)

If only I can go into Uboot prompt on serial somehow...
