Which one of the candies?

It works here, but i must admit i've been there too.

Candi is a bitch and will bitch whenever she likes.

Best bet is to wipe Candi completely off of your HDD and reinstall the latest version.

That fixed it for me.

AND...NEVER EVER change the settings...Candi has a 50% chance to corrupt it's own ENVARC: settings file and you'll get a crash on the next boot.

^^^

Everything reported on the tracker since years, but development on Candi is dead
