IExec and IDos is already opened for normal programs, if writing real Amiga libraries you need to open the libs, as then the normal startup code is not called.

When you write SDL program you need to call `init_sdl()`, it can good place to check if the library was opened before or not. Then you call `SQL_Quit()`, if SDL needed to open libs, only then should it close the libraries.

.so files are linked when program starts, so it should be no different to .a file.

As programmer I do not want to worry about what SDL has opened or not.
