There was a pre-enhancer2.0 graphics upgrade package available which contained the RadeonHD3.7 driver and the RadeonRX1.4 driver. This package would give you a free upgrade to the full enhancer2.0 package. So if you've bought it, you can upgrade to 2.0 without charge. (Second tab in upgrader program)

The HD7770 has been rebranded to R7 250X. This card been reported to work fine with the Radeon driver.

To make the best use of your HD7770 you should own Enhancer2.0.

If you want to play old minigl or warp3d games than you should also buy the Warp3D-SI package. (eg Shogo)

If you only want to play the new Warp3DNova and openGLes2 games (Eg spencer and kas1e releases) than you do not need this package.
