@Joel

Radeon RX550 and RX560 are for now the best supported cards. Afaik, a fix is in betatest for the RX570 and RX580.

Some users (like me) have issues with a crashing UVD driver. But it has been reported that this is fixed and in betatest as well.

Workbench can only use 256 MB. This iirc is a limitation of the graphics.library.

Warp3DNova and ogles2 applications can use the full 4GB on those cards.
