CPU/RAM/GFX

The double click "detection" uses the Input prefs "double click delay", so if you have a "long" value (1.5sec)

AmiDock thinks it's a double click. I have it set to 0.50sec

FR

To move dockyiwndow:

-Click on docky to make the window come up.

-Press CTRL+AMIGA (Right or Left).

-Hold those keys and click anywhere into that window with LEFT mouse button and mve it around.

AFAIK this is a feature of all Workbench/OS4 windows.

NET

Haven't touch Net.Docky, couldn't compile on my system, so didn't update like other 3 dockies.

CRASH

Will try to repduce such crahs/freeze THX.

THX for feedback
