I have big problem with booting my X5000 after replacing my cpu fan with a better one. It booted twice after that with 54c in temperature.

Now i just get a black screen with no text except "No signal". Its just black. Everything sounds like its starting but the screen is still black. Can i have fucked up the CPU? What happens if the uboot file is damaged?

I appreciate all help i can get. I m waiting for another Radeon card RX560. The one i have now is a Radeon HD7700.
