Can i have fucked up the CPU? What happens if the uboot file is damaged?

Sure not. If the x5k processor overheats, then x5000 simply turns off (i learn that when plays with temperature dockies and different fans). But then, you can power on it again and it will work.

And that is just only in case if your CPU FAN stops working (and be sure you connect it directly to PSU as I point out everywhere, when connecting to the motherboard, those Noctua fans can sometimes not starting up on the boot).

Next, if all fine, you only can go the usual way: serial debugging, attaching the serial cable to another computer, and see when / how it stops.
