From PatchCompositeTags documentation:

"Do not enable the composition effects on the WB Do not start several progs using the compositing at the same time as this program is not a real .library and therefore does not allow this".

If you are using SDL2-based applications, could you try the following workaround, type:

```
setenv SDL_RENDER_DRIVER "software"
```

Then start applications. Now, SDL2 tries to default to SW rendering and in theory you don't need PatchCompositeTags but however some programs may be adamant and force HW acceleration anyway.
