I'd argue that CSS is still more important than Javascript. You need CSS first for Javascript layout to function.

The majority of websites need CSS to even display correctly. A lot (far less, but increasing as you say) need Javascript for navigation/display/functionality.

NetSurf has the CSS, and the Javascript is basic currently - there are thousands of bindings that need to be written, and only a couple of developers working on them. The layout engine needs rewriting too, as the current one isn't dynamic - so dynamic content changes cannot work at the moment.

It's slow progress, but web browsers are complicated and NetSurf is written by a handful of people in their spare time - massive difference to Chrome or Firefox. [Contributions are welcome.](#)
