- Exchanger: Enhancement request: show the keyboard shortcut (hotkey) for the selected commodity in the "information box"

Commodities do not register their hotkeys in a way that they can easily be retrieved. As an application programmer, all you get from the system is a struct CxBrokerCopy for each running commodity, which provides some information about the respective commodity broker but, sadly, not about the hotkey. (This is because hotkeys are associated with CxFilter objects, rather than CxBroker objects.)

One possible way would be to locate each file associated with the commodity (if it exists), find its icon (if it exists), parse the tooltypes and see if the hotkey is stored there. Unfortunately, I'm unable to work on Exchanger at the moment due to more pressing matters.
