Archiver already supports the ARCHIVE and DESTINATION tooltypes same as UnArc.

The ARCHIVE tooltype can be used to either set an archive that is always opened initially when the program is run or just to set a default path for the ASL requester used for opening archives.

The DESTINATION tooltype sets the initial destination path (default is RAM: if the tooltype is not set).

Yes, it does, but not as cli command.

Failed to open archive 'destination'.

It also lacks some kind of AUTOEXTRACT option (like the one from UnArc), which makes it impossible to use it from contextmenus or some other scripts.
