URL:

Does maybe anyone know what kind of tricks were performed (or what special encoder/decoder were used) to play back the fmv's from Nightlong Amiga?

None of the players (amiga and pc) can play them and so far I also haven't found any similarities with a hex editor (or deficons, which has a neat LEARN option that finds similarities).

There is no "fmv" or any other tag to be found in the files.

Did clickboom maybe use on-the-fly encoders/decoders?

Any information is helpful, thank you
