Problem with MUI PopasObject

Author: : Deniil

Date: : 2021/6/23 9:05:11

URL:

I have a project that runs a MUI GUI on a separate process that I start with NP_Child,true. The rest is pretty much default.

Everything works fine. I have a message passing system between tasks so no cross-thread access of MUI etc. But I cannot include PopasObject in the GUI because then the GUI creation crashes with wierd and random results. DAR is typically 0x39553933 ("9U93").

If I remove PopasObject from the MUI GUI creation tree all else works fine.

Does PopasObject have a problem with being run on a process other than main?

OS4 latest final update.
