1. there is a MUI bugtracker at <https://github.com/amiga-mui/muidev/issues>
2. just a single register content from a crashlog does not help anybody. Please provide a full crashlog. And if possible please use the debug version of muimaster.library to get a more detailed crashlog.
3. Popasl.mui is a subclass of Popstring.mui and does nothing fancy but allocating an Asl requester in its constructor. have you tried Popstring directly in your application?
