eMail app

Is there a continued email app for amigaos4 available?
Preferably with imap support?

One that doesn't rely on a bloated package beneath it (i.e. amicygnix)?

I know of YAM (which i stopped using years ago because of discontinuity and back then still missing imap) and simplemail (which i don't know at all)

Reason is that my mail provider finally locked out Odyssey from using their website directly (and i'm fed up finding the correct hoops to jump through to get it to work for the next few weeks, like spoofing, js usage etc.)

Of course it would be best to get an update to Odyssey, but that too would only be a temporary fix and won't happen soon anyway...if ever.

Thank you for all hints
