If it only webkit based part, without morphos's based code for GUI, then it can be a bit of help, but :

our GCC has bugs that need to be fixed before modern WebKit will works., no one fixed them. For example, a one reported a year ago (strange that you forgot about, I remember you were involved in a discussion about it as well):

<https://github.com/sba1/adtools/issues/82>

And also ince you will hit with any issue in the kernel of os4, or with os4 itself: bad luck, you know how things with os4 when it comes to fixing something `_right now and release_`.

No one in sane mind will step in that mess IMHO :) On Morphos it is possible because people who wrote browsers are also involved in the writing morphos itself. With OS4 you know what we have now.
