Checking in on best approach to getting a cross compiler up that supports `std::max_align_t`. Does sba or sodero for k currently support and do I need to build a more up to date cLib as I know newlib does not support this

The answer is yes and yes.

If you follow the adtools guide and checkout and build gcc 11.1.0 it should work. It will also build my clib2 fork which is needed for c++11/17/2a.
