What type of memory does it have? Do you happen to have the product code for it?

>- No HDMI out (although it works in MorphOS annoyingly). DVI out and VGA out are fine.

Very strange. What might cause that...? I have a HD 5450 and a R7 240, and both work with HDMI, DVI and VGA.

>- Max 1080P resolution at 60Hz

Is that limitation only due to the DVI/VGA? If HDMI works with MOS, can you there get higher resolutions?

>- No Warp 3D/Nova support so no Blender, no Shaderjoy

>- No accelerated video in Emotion/Odyssey

Yes, that is the limitation of our software. On the bright side, with Linux there is 3D and accelerated video (but only with low resolutions).
