URL:

Hey fellow scripters,

i'd like to use two separate "macros" in my AREXX script

...

long and broing arexx script:

EXIT

FirstMacro:

do something important

SecondMacro:

do something even more important

...

How do i tell AREXX to stop after the first macro has been executed and return to the main script?

That works if i only use one macro and the execution reaches EOF, but right now with two macros in place, i call FirstMacro, but AREXX keeps jumping over the SecondMacro destination and tries to execute that as well (which will lead to errors, since it lacks mandatory information not given by calling FirstMacro).

Is there some kind of "end macro" character?

Like a simple ":" at the end of one macro or a turned around leap destination, like ":FirstMacro"?

I didn't find anything in my books.

Thanks a lot
