- a) the XML file that is available will be read and checked and any newly registered app will be added
- b) if there isn't an XML file found or can't be read then every registered app (on start or while running) will be added to a newly created XML settings file

Yes both of those.

One possibility is that some app you register is causing some dud characters to be added the xml, that should be correctly escaped, but who knows.

I can't create a debug build as I don't have the latest source only for the last 53.xx version.

If you raise a mantis and make sure M3X is assigned, he might be able to look at it.
