I tried it when it became available and tinkered with it a short time.

Then it started to annoy the hell out of me because of random crashes, extreme memory and cpu hogging and trashing some of my data due to write fails/crashes.

I deleted it and never bothered to try again...there wasn't *\*any\** progress regarding bug fixes or development after the initial release anyway, so it was a bugged piece of mess back then and it's even worse now.
