Thanks for the tip about the technical manual! But I was not able to find from it a) where the motherboard sensor(s) and b) the pcie-switch are located.

Or is the pcie-switch possibly the chip which has a heat sink on it but no fan? (located on the Cyrus board near the corner diagonally opposite to the battery holder)

This pcie-temperature seems to be the most sensitive to the blow speed setting of the case fans, which would be logical if it has a heat sink.
