Hmm... I do not understand how those browsers which can show streams do the trick. Do they have a huge library of such scripts, hiding in some drawer?

>I had a look on that website, and seems doable to create such a script. The thing is that the videos are all 1080p, and without a Gfx card that

>supports va.library, it won't be able to play those videos in a good viewable speed.

Thank you for checking it! I tested also with Linux, and I was able to run a stream ( [https://sportdeutschland.tv/deutsche-e ... belhorn-trophy-2021-tag-1](https://sportdeutschland.tv/deutsche-e...belhorn-trophy-2021-tag-1) )in Spiderweb, but unfortunately the colors are wrong due to the endianness issue. BTW, are there nowadays any monitors which could 'fix' that problem by swapping colors, if needed?
